Licensing MXL Products

Overview

MXL products are licensed for lifetime.

A license embodies one or more rights to execute a MXL program. It is implemented by a license key, which needs to be activated on the computer executing the MXL program.

A license is node-locked to a computer and can be used for unlimited time. In addition a time-limited maintenance plan is offered, which entitles the licensee to run updated releases of the licensed software.

A license can be activated for multiple users on the same computer, and only one license activation is used for all of them.

With the purchase of the license a maintenance plan valid for one year is included, beginning with the activation of the license.

An activation of a lifetime license is bound to a specific computer for the complete lifetime, although repetitive partial hardware replacements are allowed.

A lifetime license can be used in an online or an offline environment.

Online

The online activation of a license requires direct Internet access to X-Software's license portal, and no further steps are necessary. Renewals of the maintenance plan and hardware changes are synchronised automatically.

Offline

In an offline environment, indirect Internet access (*sneaker net*) may be used for the (re-)activation, although the procedure would be simpler with direct Internet access. Renewals of the maintenance plan and hardware changes have to be synchronised manually by reactivating the license.

Hardware replacement

Partial hardware changes over the time are allowed, but have to be synchronised with X-Software's license portal in order to keep the activation up to date. Otherwise the license may become unusable if too many hardware changes have accumulated.

In case of a complete hardware failure, X-Software may replace a license on their sole discretion.
